# How to use **FEMTIC**

#### 1. Serial calculation

- 1) Copy all input files to a work directory.
- 2) Write '1' below 'NUM\_THREADS' in 'control.dat'.
- 3) In the work directory, execute the following command. *femtic*

#### 3. Parallel calculation only using OpenMP

- 1) Copy all input files to a work directory.
- 2) Write number of threads below 'NUM\_THREADS' in 'control.dat'.

< Example >

NUM\_THREADS

- 4
- 3) In the work directory, execute the following command. *femtic*

#### 2. Parallel calculation only using MPI

 Copy all input files to a work directory.
 Write '1' below 'NUM\_THREADS' in 'control.dat'.
 In the work directory, execute the following command. *mpiexec –n [Number of MPI processes] femtic*

#### 4. Hybrid MPI/OpenMP parallel calculation

- 1) Copy all input files to a work directory.
- 2) Write number of threads below 'NUM\_THREADS' in 'control.dat'.

< Example >

NUM\_THREADS

#### 4

In the work directory, execute the following command.
 mpiexec –n [Number of MPI processes] femtic

## **OpenMP-MPI** hybrid parallelization

OpenMP-MPI Hybrid parallelization speed up the forward and inversion calculation.

#### **Input files**

File name	Content
control.dat	Parameters controlling FEMTIC
mesh.dat	Data of computational mesh
resistivity_block_iter[Iter#].dat	Data of parameter cells and initial resistivity values
observe.dat	Observation data
distortion_iter[Iter#].dat	Initial parameters of galvanic distortion

In the file names, [Iter#] indicates the start number of the iteration. The start number of the iteration can be specified in 'ITERATION' data in 'control.dat'.

# File format of control.dat (1/9)

This file contains the parameters controlling FEMTIC.

Keyword	Content	Data type	Option	Default	Example
MESH_TYPE	Type of element	Integer (0 or 1)	<ul> <li>0: Brick hexahedral element</li> <li>1: Tetrahedral element</li> <li>2: Deformed non-conforming hexahedral element</li> </ul>	0	MESH_TYPE 1
INV_METHOD	Type of inversion method	Integer (0 or 1)	0: Model space method 1: Data space method	0	INV_METHOD 0
DATA_SPACE_METHOD	Type of data- space method	Integer (1 or 2)	<ol> <li>Inverse of roughening matrix <i>R</i> is used in the data-space method</li> <li>Inverse of <i>R</i><sup>T</sup><i>R</i> matrix is used the in data-space method</li> </ol>	1	DATA_SPACE_METHOD 1
NUM_THREADS	Number of threads	Integer greater than or equal to 1		1	NUM_THREADS 4
FWD_SOLVER	Mode of direct sparse solver <sup>*1)</sup>	Integer (0, 1 or 2)	<ul> <li>0: In-core mode</li> <li>1: Out-of-core mode is selected when the amount of the memory required by the direct solver is larger than that specified below 'MEM_LIMIT'; otherwise in-core mode is selected.</li> <li>2: Out-of-core mode.</li> </ul>	0	FWD_SOLVER 0

\*1) In the in-core mode, all information required by the direct solver is stored in memory. On the other hand, in the out-of-core mode, some of the information are stored to and read from temporary data files at hard disk. Computational speed of the in-core mode is much higher than that of the out-of-core mode. However, the in-core mode requires much more memory than the out-of-core mode.

# **Type of element**

1. Brick hexahedral element

Topography/bathymetry cannot be incorporated.

- 2. Tetrahedral element
- 3. Non-conforming deformed hexahedral mesh

Discretization method of non-conforming deformed hexahedral mesh is based on that of Grayver & Burg (2014).

In FEMTIC, the division number of one side can be double compared to the other side only in the horizontal direction.

Grayver, a. V., & Burg, M. (2014). Robust and scalable 3-D geo-electromagnetic modelling approach using the finite element method. Geophysical Journal International. https://doi.org/10.1093/gji/ggu119

Tetrahedral element

Non-conforming deformed hexahedral element

# File format of control.dat (2/9)

Keyword	Content	Data type	Option	Default	Example
MEM_LIMIT	The maximum amount of memory (in MB) for direct sparse solver	Real number greater than 0		3000(MB)	MEM_LIMIT 3000
DIV_NUM_RHS_FWD	Division number of the right-hand- side vectors of the linear equation solved for the calculation of sensitivity matrix <sup>*1)</sup>	Integer greater than or equal to 1		1	DIV_NUM_RHS_FWD 1
DIV_NUM_RHS_INV	Division number of the right-hand- side vectors of the linear equation solved for the calculation of the updates of model parameters. This option is used only when the data- space method is selected <sup>*2</sup>	Integer greater than or equal to 1		1	DIV_NUM_RHS_INV 1

\*1) In calculating sensitivity matrix, a linear equation with multiple right-hand-sides is solved. When division number of the right-hand-side vectors is one, a routine of PARDISO is called one time to solve the linear equation. On the other hand, when the division number is more than one, that routine is called the specified times and the number of right-hand-side vectors at each time is inversely proportional to the division number as shown in the next slide. In general, the smaller the division number becomes, the faster the speed for solving a linear equation becomes. However, the smaller the division number is, the more memory is required.

\*2) When the data-space method is used, a linear equation with multiple right-hand-sides is solved for the calculation of the updates of model parameters. When division number of the right-hand-side vectors is one, a routine of PARDISO is called one time to solve the linear equation. On the other hand, when the division number is more than one, that routine is called the specified times and the number of right-hand-side vectors at each time is inversely proportional to the division number as shown in the next slide. In general, the smaller the division number becomes, the faster the speed for solving a linear equation becomes. However, the smaller the division number is, the more memory is required.

(1) Division number of the right-hand-side vectors is one

# File format of control.dat (3/9)

Keyword	Content Data type		Content Data type Option		Default	Example
ELEC_FIELD	Type of the electric field used to calculate response functions	Integer (0, 1 or -1)	<ul> <li>0: Horizontal electric field</li> <li>1: Tangential electric field</li> <li>-1: Type of the electric field of each station is individually selected *2)</li> </ul>	0	ELEC_FIELD 0	
OWNER_ELEMENT	Type of owner element <sup>*1)</sup> of observation stations	Integer (0, 1 or -1)	<ul> <li>0: Downward element</li> <li>1: Upward element</li> <li>-1: Type of owner element of each station is individually selected <sup>*2)</sup></li> </ul>	0	OWNER_ELEMENT 0	
RESISTIVITY_BOUNDS	Type of the method limiting subsurface resistivity to be estimated	Integer (0 or 1)	<ul> <li>0: When a resistivity value is exceeds the upper limit or become less than the lower limit, the resistivity value is forced to be the upper limit or the lower limit, respectively.</li> <li>1: The method proposed by Kim and Kim (2010) <sup>*3</sup> is used.</li> </ul>	0	RESISTIVITY_BOUNDS 0	

\*1) Owner element denotes the element in which the electric field and magnetic field of the observation station are interpolated.

\*2) When this option is selected, you need to specify the type of the electric field and/or the owner element for each station in 'observe.dat'.

\*3) The method is described in detail in the next slide.

Kim, H. J., & Kim, Y. (2010). A unified transformation function for lower and upper bounding constraints on model parameters in electrical and electromagnetic inversion. Journal of Geophysics and Engineering, 8(1), 21–26. https://doi.org/10.1088/1742-2132/8/1/004

$$x = \frac{1}{n} ln \left( \frac{m - m_{min}}{m_{max} - m} \right) \qquad \qquad m = log_{10}(\rho) \qquad \qquad \rho : \text{Resistivity } (\Omega \text{m}) \\ m_{min} = log_{10}(\rho_{min}) \qquad \qquad \rho_{min} : \text{Lower limit of resistivity } (\Omega \text{m}) \\ m_{max} = log_{10}(\rho_{max}) \qquad \qquad \rho_{max} : \text{Upper limit of resistivity } (\Omega \text{m}) \end{cases}$$

In the method proposed by Kim and Kim (2010), the range of resistivity is constrained by the above equation and parameter x.

Updates of parameter x ( $\delta x$ ) is calculated by the following equation from the update of the common logarithm of resistivity ( $\delta m$ ).

$$\delta x = \frac{\partial x}{\partial m} \delta m = \frac{m_{max} - m_{min}}{n(m_{max} - m)(m - m_{min})} \delta m$$

Next, the new resistivity is calculated from the previous values of x ( $x_{pre}$ ) and  $\delta x$  by the equation below.

$$ho = 10^m$$

$$m = \frac{m_{max} - m_{min}}{2} \tanh\left(\frac{nx}{2}\right) + \frac{m_{min} + m_{max}}{2} = \frac{m_{max} - m_{min}}{2} \tanh\left(\frac{n(x_{pre} + \delta x)}{2}\right) + \frac{m_{min} + m_{max}}{2}$$

Kim, H. J., & Kim, Y. (2010). A unified transformation function for lower and upper bounding constraints on model parameters in electrical and electromagnetic inversion. *Journal of Geophysics and Engineering*, 8(1), 21–26. https://doi.org/10.1088/1742-2132/8/1/004

# File format of control.dat (4/9)

Keyword	Content	Data type	Option	Default	Example
SMALL_VALUE	A small positive value used to regularize roughening matrix (Usui et al., 2017). This option is necessary only when the data-space method is selected.	Positive real number			SMALL_VALUE 1.0e-4
OUTPUT_PARAM	Number of output variables	Integer greater than or equal to 0			OUTPUT_PARAM 2 0 4
	Output variables for the visualization with ParaView *1)	Integer(s)			
OFILE_TYPE	Format of output file for ParaView	Integer (0 or 1)	0: VTK file format (ASCII) 1: Ensight Gold file format (binary)	1	OFILE_TYPE 1
MOVE_OBS_LOC	When you write this keyword, observation station is forced to be located at the center of the element face				MOVE_OBS_LOC

\*1) Detail of this option is described in the next slide.

# Format about the keyword 'OUTPUT\_PARAM'

Under the keyword, you write the number of output variables first.

Following the number, you need to write the index numbers of the variables needed.

The variables you selected are outputted by VTK file format (ASCII) or Ensight Gold file format (binary) depending on the setting of 'OFILE\_TYPE'.

The output files can be read and visualized by ParaView.

#### <Example>

By the following setting, the resistivity and sensitivity are only outputted.

OUTPUT\_PARAM 2 0 4

#### Output file names of Ensight Gold file format

Index	Variable type	Output file name
0	Resistivity	Resistivity.iter[Iter#]
1	Electric field	ReE_Freq[Freq#]_ExPol.iter[Iter#] ImE_Freq[Freq#]_ExPol.iter[Iter#] ReE_Freq[Freq#]_EyPol.iter[Iter#] ImE_Freq[Freq#]_EyPol.iter[Iter#]
2	Magnetic field	ReH_Freq[Freq#]_ExPol.iter[Iter#] ImH_Freq[Freq#]_ExPol.iter[Iter#] ReH_Freq[Freq#]_EyPol.iter[Iter#] ImH_Freq[Freq#]_EyPol.iter[Iter#]
3	Electric current	Rej_Freq[Freq#]_ExPol.iter[Iter#] Imj_Freq[Freq#]_ExPol.iter[Iter#] Rej_Freq[Freq#]_EyPol.iter[Iter#] Imj_Freq[Freq#]_EyPol.iter[Iter#]
4	Sensitivity	Sensitivity.iter[Iter#] NormalizedSensitivity.iter[Iter#]
5	Sensitivity density	SensitivityDensity.iter[Iter#] NormalizedSensitivityDensity.iter[Iter#]

\*1) When you select VTK file format (ASCII) as output file format, output variables are written in the files named as 'result\_[PE#]\_iter[Iter#].vtk'.

\*2) In the file names, [PE#] and [Iter#] indicate process number and iteration number, respectively.

#### File format of control.dat (5/9)

Keyword	Content	Data type	Option	Default	Example
DISTORTION	Treatment of galvanic distortion	Integer (0, 1, 2 or 3)	<ul> <li>0: Distortion matrix is not estimated</li> <li>1: Differences of distortion matrix and unit matrix are estimated.</li> <li>2: Both gains and rotations are estimated*<sup>1)</sup>.</li> <li>3: Only gains are estimated.</li> </ul>	None. You must write this keyword and an option.	DISTORTION 1
TRADE_OFF_PARAM	Trade-off parameters	Real positive value(s)	The number of option(s) depends on the option of the keyword 'DISTORTION'. If the option of 'DISTORTION' is '0', you should write only trade-off parameter $\alpha$ . If the option of 'DISTORTION' is '1' or '3', you should write trade-off parameters $\alpha$ and $\beta$ . If the option of 'DISTORTION' is '2', you should write trade-off parameters $\alpha$ , $\beta_1$ and $\beta_2$ .	None. You must write this keyword and option(s).	TRADE_OFF_PARAM 1.0 0.1
ITERATION	Start and end iteration number	Two integers greater than or equal to 0	Start and end iteration number	None. You must write this keyword and options.	ITERATION 0 10
CONVERGE	Convergence threshold (%) of Gauss- Newton iteration	Real value greater than 0	If the change rates of the objective function and its respective terms of the current iteration from those of the previous iteration are less than the threshold value, the Gauss- Newton iteration is finished.	1.0	CONVERGE 1.0

\*1) Distortion matrix is decomposed as Smith (1995)

Smith, J. T. (1995). Understanding telluric distortion matrices. Geophysical Journal International, 122(1), 219–226. https://doi.org/10.1111/j.1365-246X.1995.tb03549.x

#### **Objective function**

The form of objective function depends on the setting of 'DISTORTION'.

#### 0: Distortion matrix is not estimated

 $\phi(\boldsymbol{m}) = \phi_d(\boldsymbol{m}) + \alpha^2 \phi_m(\boldsymbol{m})$ 

 $\phi_d(\boldsymbol{m})$ : Data misfit  $\phi_m(\boldsymbol{m})$ : Model roughness  $\alpha$ : Trade-off parameter

#### 1: Differences of distortion matrix *C* and unit matrix are estimated

$$\phi(\boldsymbol{m}) = \phi_d(\boldsymbol{m}) + \alpha^2 \phi_m(\boldsymbol{m}) + \beta^2 \phi_c(\boldsymbol{m})$$

 $\phi_{d}(\boldsymbol{m}): \text{ Data misfit, } \phi_{m}(\boldsymbol{m}): \text{ Model roughness}$   $\phi_{c}(\boldsymbol{m}) = \sum_{i=1}^{\#sites} \left[ |c'_{xx}|^{2} + |c'_{xy}|^{2} + |c'_{yx}|^{2} + |c'_{yy}|^{2} \right]$   $\alpha, \beta: \text{ Trade-off parameter}$   $\boldsymbol{C}' = \boldsymbol{C} - \boldsymbol{I} = \begin{pmatrix} c_{xx} & c_{xy} \\ c_{yx} & c_{yy} \end{pmatrix} - \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} c'_{xx} & c'_{xy} \\ c'_{yx} & c'_{yy} \end{pmatrix}$ 

#### 2: Both gains and rotations are estimated

$$\phi(\mathbf{m}) = \phi_d(\mathbf{m}) + \alpha^2 \phi_m(\mathbf{m}) + \beta_1^2 \phi_{c1}(\mathbf{m}) + \beta_2^2 \phi_{c2}(\mathbf{m})$$

$$\phi_{d}(\boldsymbol{m}): \text{Data misfit, } \phi_{m}(\boldsymbol{m}): \text{Model roughness}$$

$$\phi_{c1}(\boldsymbol{m}) = \sum_{i=1}^{\#site} \left[ G_{x}^{2} + G_{y}^{2} \right], \phi_{c2}(\boldsymbol{m}) = \sum_{i=1}^{\#site} \left[ \beta_{x}^{2} + \beta_{y}^{2} \right]$$

$$\alpha, \beta_{1}, \beta_{2}: \text{Trade-off parameter}$$

$$\boldsymbol{C} = \left( 10^{G_{x}} \begin{pmatrix} \cos\beta_{x} \\ \sin\beta_{x} \end{pmatrix} \quad 10^{G_{y}} \begin{pmatrix} -\sin\beta_{y} \\ \cos\beta_{y} \end{pmatrix} \right)$$

#### 3: Only gains are estimated.

$$\phi(\boldsymbol{m}) = \phi_d(\boldsymbol{m}) + \alpha^2 \phi_m(\boldsymbol{m}) + \beta^2 \phi_c(\boldsymbol{m})$$

 $\phi_d(\mathbf{m})$ : Data misfit,  $\phi_m(\mathbf{m})$ : Model roughness  $\phi_c(\mathbf{m}) = \sum_{i=1}^{\#site} [G_x^2 + G_y^2]$   $\alpha, \beta$ : Trade-off parameter  $\mathbf{C} = \begin{pmatrix} 10^{G_x} & 0\\ 0 & 10^{G_y} \end{pmatrix}$ 

# File format of control.dat (6/9)

Keyword	Content	Data type	Option	Default	Example
ROUGH_MATRIX	Way of making roughening matrix <sup>1)</sup>	Integer (0, 1, 2 or -1)	<ul> <li>0: Based on element</li> <li>1: Based on parameter cell</li> <li>2: Based on element (with weights based on area-volume ratio)</li> <li>-1: From external file 'roughening_matrix.dat' <sup>2)</sup></li> </ul>	0	ROUGH_MATRIX 0
OUTPUT_ROUGH_MATRIX	Output roughening matrix as an external file <sup>2)</sup> 'roughening_matrix.out'				OUTPUT_ROUGH_MATRIX
BOTTOM_RESISTIVITY	Give a resistivity below the bottom of mesh. By using this option, roughening matrix <i>R</i> will be regularized and then data-space inversion is stabilized	Positive real value			BOTTOM_RESISTIVITY 10.0
ALPHA_WEIGHT	Make regularization depend on directions <sup>1)</sup>	Three non- negative values		1 1 1	ALPHA_WEIGHT 1 100 1

\*1) Detail of this option is described in the following slides.

\*2) Format of this file is explained in the later slides.

# Way of making roughening matrix (1/2)

(1) Based on parameter cell

2) E	Based on element * Because elements 1 and 2 (3 and 4) belong to parameter cell, differentiation between the two elements is not considered.	Column corresponding to element 1	Column corresponding to element 2	Column corresponding to element 3	Column corresponding
	Row corresponding to element 1	/ 1	0	-1	0
	Row corresponding to element 2	0	1	0	-1
	Row corresponding to element 3	-1	0	1	0
	Row corresponding to element 4	\ 0	-1	0	1

In this figure, different colors indicate different parameter cells and italic numbers indicate element numbers. For simplified explanation, in this example, 2-D structure is treated.

Column corresponding

to parameter cell 2

Column corresponding

to parameter cell

Components of roughening matrix are calculated from the components of the roughening matrix based on the relation of elements

Row corresponding to parameter cell 1

Row corresponding to parameter cell 2

# Way of making roughening matrix (2/2)

(3) Based on element (with weights based on area-volume ratio)

	Column corresponding to parameter cell 1	Column corresponding to parameter cell 2	Column corresponding to parameter cell 3	Column corresponding to parameter cell 4
Row corresponding to parameter cell 1	$\frac{S_{1,2} + S_{1,3}}{V_1}$	$-\frac{S_{1,2}}{V_1}$	$-\frac{S_{1,3}}{V_1}$	0
Row corresponding to parameter cell 2	$-\frac{S_{2,1}}{V_2}$	$\frac{S_{2,1} + S_{2,4}}{V_2}$	0	$-\frac{S_{2,4}}{V_2}$
Row corresponding to parameter cell 3	$-\frac{S_{3,1}}{V_3}$	0	$\frac{S_{3,1} + S_{3,4}}{V_3}$	$-\frac{S_{3,4}}{V_3}$
Row corresponding to parameter cell 4	0	$-\frac{S_{4,2}}{V_4}$	$-\frac{S_{4,3}}{V_4}$	$\frac{S_{4,2} + S_{4,3}}{V_4}$

 $V_X$  indicates the volume of element X.

 $S_{X,Y}$  indicates the area of the face shared by element X and Y.

In this figure, different colors indicate different parameter cells and italic numbers indicate element numbers.

For simplified explanation, in this example, 2-D structure is treated.

In this example, respective elements have respective different parameter cells.

## Format of 'roughening\_matrix.out' and 'roughening\_matrix.dat'

Example		Column corresponding to parameter cell 1	Column corresponding to parameter cell 2	Column corresponding to parameter cell 3

Row corresponding to parameter cell 2	R =	-1	2	-1	
Row corresponding to parameter cell 3		0	-1	1 /	
					4↓ ← Total num 0↓ ← Paramete 0↓ ← Numbers

# **Option ALPHA\_WEIGHT**

Three values under 'ALPHA\_WEIGHT':  $w_x w_y w_z$ 

Resultant weights:

$$w_{1,2} = \sqrt{\frac{\left(w_x \Delta x_{1,2}\right)^2 + \left(w_y \Delta y_{1,2}\right)^2 + \left(w_z \Delta z_{1,2}\right)^2}{\Delta x_{1,2}^2 + \Delta y_{1,2}^2 + \Delta z_{1,2}^2}}$$

$$w_{1,3} = \sqrt{\frac{\left(w_x \Delta x_{1,3}\right)^2 + \left(w_y \Delta y_{1,3}\right)^2 + \left(w_z \Delta z_{1,3}\right)^2}{\Delta x_{1,3}^2 + \Delta y_{1,3}^2 + \Delta z_{1,3}^2}}$$

$$w_{1,4} = \sqrt{\frac{\left(w_x \Delta x_{1,4}\right)^2 + \left(w_y \Delta y_{1,4}\right)^2 + \left(w_z \Delta z_{1,4}\right)^2}{\Delta x_{1,4}^2 + \Delta y_{1,4}^2 + \Delta z_{1,4}^2}}$$

Roughening matrix  $R = \begin{pmatrix} w_{1,2} + w_{1,3} + w_{1,4} & -w_{1,2} & -w_{1,3} & -w_{1,4} \\ & -w_{1,2} & & \ddots \\ & & -w_{1,3} \\ & & -w_{1,4} \end{pmatrix}$ 

# File format of control.dat (7/9)

Keyword	Content	Data type	Option	Default	Example
DIFF_FILTER	Type of norm	Integer (1 or 2)			DIFF_FILTER
	$\varepsilon_1, \varepsilon_2$	Positive real values			1
	Maximum iteration number of iteratively reweighted least-squares algorithm	Positive real value			5 10
	Convergence threshold (%) of IRLS algorithm	Real value greater than 0			

- If this option is used, difference filter is used for roughening matrix instead of Laplacian filter.
- ✓  $L_1$  norm can be used in addition to  $L_2$  norm.
- ✓ When L₁ norm is selected, iteratively reweighted least-squares (IRLS) algorithm (Farquharson & Oldenburg, 1998) is used within the model update phase.
- $\checkmark$  Weight w multiplied to the roughening matrix (difference filter) is

$$w = \sqrt{0.5/d}$$

 $d = \min(\max(\varepsilon_1, |log_{10}(\rho) - log_{10}(\rho_{neib})|), \varepsilon_2)$ 

- IRLS is stopped when the iteration number reaches the specified maximum value or change rate of the model roughness is less than the convergence threshold.
- To use this option, you need to select the data-space method, and the inverse of RTR matrix is used in the data-space method.

Example of difference filter with $L_2$ norm	Example of difference filter with L <sub>1</sub> norm

#### File format of observe.dat

The following response functions can be used as the observed data.

Impedance tensor

$$\begin{pmatrix} E_{x} \\ E_{y} \end{pmatrix} = \begin{pmatrix} Z_{xx} & Z_{xy} \\ Z_{yx} & Z_{yy} \end{pmatrix} \begin{pmatrix} H_{x} \\ H_{y} \end{pmatrix}$$

Vertical magnetic transfer function (Tipper)

 $H_z = \begin{pmatrix} T_{zx} & T_{zy} \end{pmatrix} \begin{pmatrix} H_x \\ H_y \end{pmatrix}$ 

Horizontal magnetic transfer function between two sites

$$\begin{pmatrix} H_{x}^{Site1} \\ H_{y}^{Site1} \end{pmatrix} = \begin{pmatrix} T_{xx} & T_{xy} \\ T_{yx} & T_{yy} \end{pmatrix} \begin{pmatrix} H_{x}^{Site2} \\ H_{y}^{Site2} \end{pmatrix}$$

Phase tensor (Caldwell et al. 2004)

$$\begin{pmatrix} \Phi_{11} & \Phi_{12} \\ \Phi_{21} & \Phi_{22} \end{pmatrix} = \begin{pmatrix} Re(Z_{xx}) & Re(Z_{xy}) \\ Re(Z_{yx}) & Re(Z_{yy}) \end{pmatrix}^{-1} \begin{pmatrix} Im(Z_{xx}) & Im(Z_{xy}) \\ Im(Z_{yx}) & Im(Z_{yy}) \end{pmatrix}$$

Response functions must be written in SI units with  $e^{-i\omega t}$  time dependence.

Apparent resistivity  

$$\rho_{a,ij} = \frac{1}{\omega\mu_0} |Z_{ij}|^2$$
Phase  

$$\theta_{ij} = \begin{cases} Arctan\left(\frac{Im(Z_{ij})}{Re(Z_{ij})}\right) (Re(Z_{ij}) \ge 0) \\ Arctan\left(\frac{Im(Z_{ij})}{Re(Z_{ij})}\right) + \pi (Re(Z_{ij}) < 0 \text{ and } Im(Z_{ij}) \ge 0) \\ Arctan\left(\frac{Im(Z_{ij})}{Re(Z_{ij})}\right) - \pi (Re(Z_{ij}) < 0 \text{ and } Im(Z_{ij}) < 0) \end{cases}$$

## Things to be careful when seafloor MT data is used

- For seafloor MT stations, it is better to interpolate the electric field and the magnetic field from the upper-side and lower-side elements, respectively (Usui et al., 2018).
- However, the use of different elements for interpolating the electric field and the magnetic field needs a bit tricky setting.
- The required setting is as follows.

- 1. Set the option of the keyword 'OWNER\_ELEMENT' of 'control.dat' to -1. By this setting, type of owner element can be individually selected for each element.
- 2. In 'observe.dat', add the dummy stations of the vertical magnetic transfer function or the horizontal magnetic transfer function at the same locations as seafloor MT stations. (If actually there are stations of the vertical magnetic transfer function or the horizontal magnetic transfer function on the same locations as the MT stations, you need not to add new dummy stations.)
- 3. For the dummy stations of magnetic transfer functions in 'observe.dat', set 'Type of the owner element' to 0 (element just below the seafloor is used for calculating the magnetic field)
- 4. For the seafloor MT stations in 'observe.dat', set 'Type of the owner element' to 1 (element just above the seafloor is used for calculating the electric field) and set 'Station ID for horizontal magnetic field' to the ID of the dummy station at the same location.

#### Things to be careful when seafloor MT data is used: Example

# How to improve response functions at high frequencies

- For land MT stations, it is better to interpolate the electric field and the magnetic field from the lower-side and upper-side elements, respectively.
- > This is because the change of the magnetic field is smaller in the upper-side (in the air).
- Otherwise, it is possible that the amplitude of the impedance tensor is overestimated unless the size of the element just below MT station is not sufficiently small.
- The recommended setting is as follows.

- 1. Set the option of the keyword 'OWNER\_ELEMENT' of 'control.dat' to -1. By this setting, type of owner element can be individually selected for each element.
- 2. In 'observe.dat', add the dummy stations of the vertical magnetic transfer function or the horizontal magnetic transfer function at the same locations as land MT stations. (If actually there are stations of the vertical magnetic transfer function or the horizontal magnetic transfer function on the same locations as the MT stations, you need not to add new dummy stations.)
- 3. For the dummy stations of magnetic transfer functions in 'observe.dat', set 'Type of the owner element' to 1 (element just above the Earth's surface is used for calculating the magnetic field)
- 4. For the land MT stations in 'observe.dat', set 'Type of the owner element' to 0 (element just below the Earth's surface is used for calculating the electric field) and set 'Station ID for horizontal magnetic field' to the ID of the dummy station at the same location.
